

7.1

# Translations

A translation moves all points of a figure the same distance in the same direction.

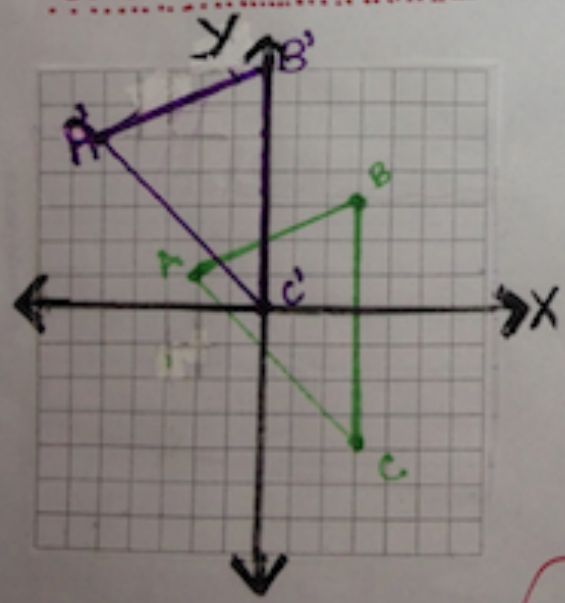

## Example 1

Translate the original figure  $\triangle ABC$  to the left 3 units <sup>3</sup> and up 4 units.  $\triangle A'B'C'$  is the image.

ONE POINT AT A TIME

\*new\* translated image ... the \*pre-image\* is the original figure.

### Rule:

$$(x, y) \rightarrow (x-3, y+4)$$

$$A(-2, 1) \rightarrow (-2-3, 1+4) \rightarrow A'(-5, 5)$$

$$B(3, 3) \rightarrow (3-3, 3+4) \rightarrow B'(0, 7)$$

$$C(3, -4) \rightarrow (3-3, -4+4) \rightarrow C'(0, 0)$$

Coordinate notation  
coordinate in terms of changes made to  $x=y$

Representing translation in coordinate plane

| pre-image | image  |
|-----------|--|
| $(x, y)$  | $(x+a, y+b)$ translation $a$ units horizontally & $b$ units vertically |

# Reflections

From  $A(3,2) \rightarrow A'(-3,2)$   
the line of reflection  
is  $x=0$

From  $A(3,2) \rightarrow A''(3,-2)$   
the line of reflection  
is  $y=0$

## \* Example 2

Reflect the original figure  $\triangle XYZ$  over  $y$ -axis or  $x=0$ , name the new figure  $\triangle X'Y'Z'$

Reflect  $\triangle XYZ$  over the  $x$ -axis or  $y=0$ , name the new figure  $\triangle X''Y''Z''$

| $\triangle XYZ$<br>original | $\triangle X'Y'Z'$<br>reflected<br>over $x=0$ | $\triangle X''Y''Z''$<br>reflected<br>over $y=0$ |
|-----------------------------|---|--|
| $X(1,1)$                    | $X'(-1,1)$                                    | $X''(1,-1)$                                      |
| $Y(1,4)$                    | $Y'(-1,4)$                                    | $Y''(1,-4)$                                      |
| $Z(3,2)$                    | $Z'(-3,2)$                                    | $Z''(3,-2)$                                      |

What do you notice?

Looking only at point  $X$ ,  
what do you notice about the coordinates  $X \rightarrow X'$ ?

what do you notice about the coordinates  $X \rightarrow X''$ ?

A reflection flips a figure over a given line of reflection so that all of the corresponding points are the same distance from the line of reflection.

\* EQUAL DISTANCES \*

\* perpendicular  $\perp$  distances \*

# Reflections cont.

## EXAMPLE 3

Reflect  $\Delta RST$   
over the line  
 $y=1$

| Preimage $\Delta RST$<br>(x, y) | IMAGE $\Delta R'S'T'$<br>(x, y) |
|---------------------------------|---------------------------------|
| R(-3, 4)                        | R'(-3, -2)                      |
| S(-4, 1)                        | S'(-4, 1)                       |
| T(-1, -1)                       | T'(-1, 3)                       |

What do you notice?

### Example 4 :

Triangle KED has coordinates K(-3, 3), E(3, -2) & D(-1, 4). If  $\Delta KED$  is reflected across the y-axis, what are the coordinates of  $\Delta K'E'D'$ ?

Rules:

FIND WITHOUT GRAPHING!!

Answer...

X-axis ( $y=0$ )  $(x, y) \rightarrow (x, -y)$

Y-axis ( $x=0$ )  $(x, y) \rightarrow (-x, y)$

Any horizontal line of reflection ( $y=n$ )  $(x, y) \rightarrow (x, 2n-y)$

Any vertical line of reflection ( $x=n$ )  $(x, y) \rightarrow (2n-x, y)$

## Generalizing Patterns

When reflecting across a vertical line  $\downarrow$ , only change the x-value to preserve the distance from each point to the line of symmetry... y stays the same.

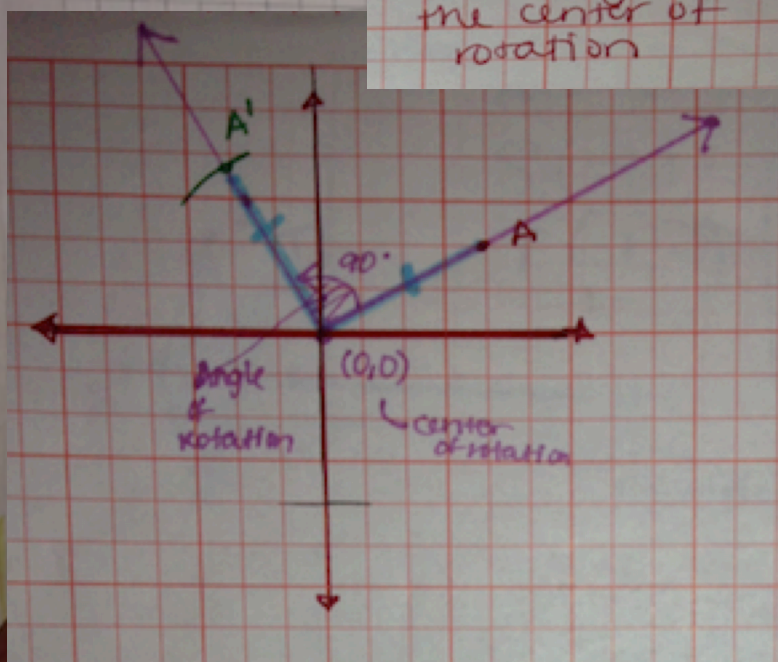

When reflecting across a horizontal line  $\leftrightarrow$ , only change the y-value to preserve the distance from each point to the line of symmetry. x-value stays the same.

7.1

# ROTATIONS

Example 4:

Rotate A counterclockwise  $90^\circ$  using the origin as the center of rotation

A rotation is a transformation where a figure is rotated about a fixed point, called the center of rotation.

Rays drawn from the center of rotation to a point on the figure & the corresponding point on the image form the angle of rotation.

A figure can be rotated in the clockwise  $\curvearrowright$  or counterclockwise  $\curvearrowleft$  direction.

## Generalizing Patterns

|                                      |   |  |  |  |
|--------------------------------------|---|--|--|--|
| original point<br>$\curvearrowright$ | coordinates after a $90^\circ$ counterclockwise rotation about the origin $(a,b)$ | coordinates after a $180^\circ$ counterclockwise rotation about the origin $(a,b)$ | coordinates after a $270^\circ$ counterclockwise rotation about the origin $(a,b)$ | coordinates after a $360^\circ$ counterclockwise rotation about the origin $(a,b)$ |
| $(x,y)$                              | $(-y,x)$  | $(-x,-y)$  | $(y,-x)$   | $(x,y)$  |
| original point<br>$\curvearrowleft$  | coordinates after a $90^\circ$ clockwise rotation about the origin $(a,b)$        | coordinates after a $180^\circ$ clockwise rotation about the origin $(a,b)$        | coordinates after a $270^\circ$ clockwise rotation about the origin                | coordinates after a $360^\circ$ clockwise rotation about the origin $(a,b)$        |
| $(x,y)$                              | $(y,-x)$  | $(-x,-y)$  | $(-y,x)$   | $(x,y)$  |

# STEPS FOR PERFORMING ROTATION USING A COMPASS

$\triangle ABC$

$A(3,1)$

$B(3,5)$

$C(6,3)$

Rotate  $\triangle ABC$   
105° counterclockwise

Using the origin  $(0,0)$   
as your center  
of rotation.

1) Draw a ray  
from the origin through  
point  $A(3,1)$

2) Place protractor on  
the ray w/ the center  
@ the origin & measure  
a 105° angle in the  
counter-clockwise direction

make a tic mark @ the  
105° mark & connect  
a ray from the origin  
through this point.

3) Place compass on the  
ray you made  $\overrightarrow{OA}$  w/  
the center on the origin.  
Use the slider to measure  
open to point  $A$ .

4) w/o moving slider, or the  
center of the compass,  
swing compass so it  
intersects the ray measuring  
the 105° angle & make an  
arc. Label the intersection  
 $A'$ .

5) Repeat steps 1-4 for  
 $B \rightarrow B'$  &  $C \rightarrow C'$

Warm-up  
coordinate  $\cong \Delta s$   
7.2

### Check for Students' Understanding

---

The coordinates of a pre-image are as follows.

$A(0, 0)$        $B(13, 0)$        $C(13, 4)$        $D(4, 4)$

Consider the coordinates of each image listed below and describe the transformation.

1.  $A'(0, -7)$        $B'(13, -7)$        $C'(13, -3)$        $D'(4, -3)$

2.  $A'(0, 0)$        $B'(13, 0)$        $C'(13, -4)$        $D'(4, -4)$

3.  $A'(0, 0)$        $B'(-13, 0)$        $C'(-13, -4)$        $D'(-4, -4)$

4. Did you have to graph the pre-image and image to describe the transformation?  
Explain your reasoning.
